Abstract—**Adders are very important components of ALU and making adders faster and more efficient will lead to lower run-time of computer programs. There are many adders of which the CLA adders are the fastest. In this paper the CLA architecture implemented computes carry out terms without using the conventional method of using carry-propagate and carry-generate signals.**

Keywords—Adders, CLA.

I. REFERENCE CIRCUIT DETAILS

Circuit of unconventional 4-bit Carry Look-Ahead adder without the carry propagate and carry generate signals directly used for carry bit generation. [1]In this architecture all the input signals are directly connected to the CLA circuits for carry bit generation. The sum bit is generated using the design same as the conventional design.
In order to generate the carry bits using CLA circuit by only using the input signals (A_i, B_i and C_0), it is necessary to use the simplified Boolean equation of carry bit which is given as follows:
$$C_1 = A_0B_0 + C_0(A_0 + B_0)$$
